

This is our sequence diagram for facility rental, because the problem specified the creation of an App to book the facilities, we made almost the whole process happen between the clubMember and the App, with just the communication with it and the Administration to save the reservation when it was finished, I think the general interaction between the clubMember was made clear, first with the request, selecting sport facilities and sport items as Synchronous Messages because the App would be checking with the backend to check for availability of these and showing it to the user, it could have been clearer to have the backend calls included in the diagram. After the Member chooses everything, the App saves the reservation to the backend and shows the confirmation to the user and the whole transaction is ended.
